
Triphenylene-based molecules as Organic Spacers for tuning structure and electronic properties of 2D perovskites materials

Researchers:

- Gregorio García Moreno. [Universidad de Valladolid](#). [1]

Idioma: Castelhana

Descrição:

Proyecto asignado a través de la Red Española de Supercomputación ([RES](#) [2]).

Two-dimensional (2D) hybrid organic-inorganic perovskites have shown great application potential in solar cells and other optoelectronic devices. Based on DFT simulations and AIMD, we study the structure, stability and electronic-structure related properties of a series of 2D Ruddlesden-Popper and Dion-Jacobson perovskites, which adopt the general formula Y_2BX_4 and YBX_4 , respectively, with Y = TriPh-based organic bication or cation, B = Pb, Sn; X = Cl, Br, I).
